1 Introduction

1.1 Purpose of the Document

This document summarizes the testing and test conclusions of GEANT4-GPU. This document uses the implementation outlined in the test plan.

1.2 Scope of the Testing

1.3 Organization

In Section 4 we provide an introduction to this report. Section 5 describes the test cases which are carried out on each function. Section 6 describes system test cases that were carried out by our team. In section 7 traceability matrices to requirements and modules are documented. Section 8 provides a summary of changes made in response to the testing results.

1.4 Usability Testing

GEANT4-GPU is a back end implementation of already existing GEANT4 modules. Therefore users will not be interacting with is directly. Since there is no direct user interaction with GEANT4-GPU. There are no usability test.

1.5 Robustness

The GEANT4-GPU functions are meant to mimic the already existing GEANT4 functions. Therefore the GEANT4-GPU functions must also mimic the the robustness of the GEANT4 functions. The accuracy section for unit tests has several unit tests designed to test the robustness of the functions.

2 Module Unit Testing

2.1 Use of Automated Testing

2.1.1 Overview

2.1.2 Generating Test Results

Our unit testing system is semi-automated. A program (`GenerateTestResults`) was written which first initializes several G4ParticleHPVector objects from data files included with Geant4 of varying numbers of entries, including the creation of one G4ParticleHPVector with 0 entries. After the vectors have been initialized, the unit-tested methods are tested with a variety of input values. These cover edge cases (i.e. negative index for array, index greater than number of elements etc.) as well as more "normal" cases. The result is then written to the results text file foFor methods that are computationally intensive, the runtimes of the method are recorded and output to a separate

2.1.3 Analyzing Test Results

Due to the nature of this implementation we need to recompile GEANT4-GPU from GPU to CPU in order to get the CPU results to compare against the GPU results. We have a unit test file which preforms all our unit tests and writes the results into a file. The user will then have to manually recompile GEANT4-GPU with GPU acceleration off. Once the unit test file is run again another results file is generated. The comparing of the results is automated by feeding them to an application that we created that will compare the test results against each other. The program outputs a summary of any differences between the two results, if there are any.

2.2 General variables used for Unit Testing

The following are variables that are used for multiple unit tests. Instead of defining them again for each unit test they are defined here only once. Other variables used for specific unit tests will be defined in their respective unit test sections
For all unit tests:

Table 3: General Unit Test Variables

Name #	Type	**Value**
n	G4double	number of entries in the G4ParticleHPVector
r1	G4double	-1.0
r2	G4double	0.0
r3	G4double	0.00051234
r4	G4double	1.5892317
r5	G4double	513.18
vec0	G4ParticleHPVector	0 entries
vec1	G4ParticleHPVector	80 entries
vec2	G4ParticleHPVector	1509 entries
vec3	G4ParticleHPVector	8045 entries
vec4	G4ParticleHPVector	41854 entries
vec5	G4ParticleHPVector	98995 entries
vec6	G4ParticleHPVector	242594 entries

2.3 Note about Performance testing

Tests on vectors A - F all behave the same. Showing accuracy for vectors A - F does not provide any extra useful information. Therefore only unit tests on vector D will be shown in the Unit Tests and Accuracy sections. Unit test interfaces for the other vectors will be omitted from this document in order to make it more readable. The unit tests were still performed on the other vectors. These unit tests on vectors of different length are done to show how increasing the size of the vector increases the execution time of some functions

2.4 = (overloaded assignment operator)

2.4.1 Method Signature

```
G4ParticleHPVector & operator = (const G4ParticleHPVector & right)
```

2.4.2 Test Description

Create a new, temporary G4ParticleHPVector object and assign the current vector to it. Output the data and the integral from the new vector.

2.4.3 Test Inputs

2.4.5 Performance

The following graph was generated from the recorded times from the unit tests.

2.5 GetPoint

2.5.1 Method Signature

```
const G4ParticleHPDataPoint GetPoint(G4int i)
```

2.5.2 Test Description

Returns the G4ParticleHPDataPoint at index `i` in the current vector. The `x` and `y` values of the point are outputted.

3 Specific System Tests

3.1 Summary of Tests Performed

System tests will be performed by running the sample code packaged with the GEANT4 installation. The Hadr04 example will be run with different materials (i.e water, uranium) and number of events. The values and conditions that are changed per test are detailed in the table below.

Table 45: System Tests

Test #	Initial State	Inputs	Outputs	Description
88	Fresh start up	Events = 2000 Material = Water	Same output as non-GPU GEANT4	HADR04 no changes
89	Fresh start up	Events = 2000 Material = Uranium	Same output as non-GPU GEANT4	HADR04 – basic example
90	Fresh start up	Events = 600 Material = Water	Same output as non-GPU GEANT4	HADR04 – Shorter test
91	Fresh start up	Events = 600 Material = Uranium	Same output as non-GPU GEANT4	HADR04 – Shorter test
92	Fresh start up	Events = 20000 Material = Uranium	Same output as non-GPU GEANT4	HADR04 – Long simulation stress Test
93	Fresh start up	Events = 0 Material = Uranium	Same output as non-GPU GEANT4	HADR04 – no runs, Edge case

3.2 System Tests Results

This section will summarize all of the results from running tests 39 through 44. Each test has an accuracy section as well as a performance section. The accuracy of the

results will be based on how well the values generated on the GPU match up with the values generated on the CPU. The performance metrics used will include user, system and real time required to run each system test.

3.3 System test # 39

This test simply runs the Hadr04 example on both the GPU and the CPU without changing the source files. The code for this example is bundled with the GEANT4 installation.

4 Traceability

The following section is used to highlight the relations of implemented test cases to requirements and modules. In doing so, we hope to draw clear reasoning upon the inclusion of such tests.

4.1 Requirements

Below is a traceability table outlining test cases and the requirements they are related to:

Table 52: Tests and Requirements Relationship

Test #	**Description**	**Requirement**
1	Performance test of functions	Req. # 4 (Speed and Latency)
2	InitializeVector	Req # 5 & 6 & 7 (Precision & Reliability & Robustness)
3	SettersandGetters	Req # 5 & 6 & 7 (Precision & Reliability & Robustness)
4	GetXSec	Req # 5 & 6 & 7 (Precision & Reliability & Robustness)
5	ThinOut	Req # 5 & 6 & 7 (Precision & Reliability & Robustness)
6	Merge	Req # 5 & 6 & 7 (Precision & Reliability & Robustness)
7	Sample	Req # 5 & 6 & 7 (Precision & Reliability & Robustness)
8	GetBorder	Req # 5 & 6 & 7 (Precision & Reliability & Robustness)

9	Integral	Req # 5 & 6 & 7 (Precision & Reliability & Robustness)
10	Times	Req # 5 & 6& 7 (Precision & Reliability & Robustness)
11	Assignment	Req # 5 & 6 & 7 (Precision & Reliability & Robustness)
12	System Test	Req # 1 & 2 & 8 & 11 (Adjacent Systems & Access)

4.2 Modules

Similarly, the following is a traceability table explicitly relating test cases to modules:

Table 53: Tests and Modules Relationship

Test #	**Description**	**Module**
1	Performance test of functions	G4ParticleVector
2	InitializeVector	G4ParticleVector
3	SettersandGetters	G4ParticleVector
